

#### **REHVA ANNUAL CONFERENCE 2015** May 8, 2015 Riga

ASSOCIATION OF HEAT, GAS AND WATER TECHNOLOGY ENGINEERS OF LATVIA

# Progress with national nZEB applications in the EU

#### Jarek Kurnitski

Professor, Vice-president REHVA Tallinn University of Technology Aalto University jarek.kurnitski@ttu.ee

REHVA <u>www.nzeb.ee</u>

## **REHVA nZEB Task Force**

- TF prepared nZEB technical definition and set of system boundaries for primary energy indicator and RER calculation in 2011
- in 2013 it was revised in cooperation with CEN, resulting in REHVA Report No:4
- TF is following nZEB technical, regulatory and policy progress
- Latest, ongoing analyses on RE contribution and RER indicator based on data from 8 nZEB office and school buildings across the EU

#### Screening of energy frames and nZEB in 2013

#### • Differences in energy frames:

- Primary energy not yet used in all countries
- Some countries (Germany, France) use reference building method, fixed values in other countries
- Both simulation (Estonia, Finland) and monthly methods (Germany, Denmark) used

#### • Inclusion of energy uses depends on country:

- Germany/residential heating energy only (space heating, DHW and heating of ventilation air)
- Germany/non-residential cooling and lighting also included (appliances not)
- Denmark appliances and in residential also lighting not included
- Sweden appliances and user's lighting not included (facility lighting incl.)
- Estonia, Finland, Norway appliances and lighting included (all inclusive)
- RES (on site renewable energy production) is not accounted in all countries or is accounted differently

## Map of European climatic zones

**REHVA** 

Pagion	Country	nZEB En	ergy perfo	RES

Data from CA EPBD Oct 2013 (Kurnitski et al. REHVA Journal 2/2014)

#### REHVA Journal 2/2014: nZEB case studies provide more reliable benchmarks than first national nZEB definitions

Energy data from four nZEB office buildings:

- Delivered heating is in first building a fuel and in last one district heat.
  Two other buildings have heat pumps, delivered heating is electricity.
- Delivered cooling is in all buildings electricity.
- On site electricity is PV in 3 buildings and bio-CHP in one building.
- All values in the table are in kWh/m<sup>2</sup>y.

Appliances may be largest component in energy balance of nZEB buildings

Climate	City,				On site	Primary		
zone	country	Heating	Cooling	Fans&pumps	Lighting	Appliances	electricity	energy
	Dion							
4	France	10.5	2.4	6.5	3.7	21.2	-15.6	44
	Gland							
4	Switzerland	6	6.7	8.1	16.3	26.8	-30.9	66
	Hoofddrop					1 1		
4	Holland	13.3	3.3	17.5	21.1	19.2	-40.4	68
	Helsinki							
5	Finland	38.3	0.3	9.4	12.5	19.3	-7.1	96

For all buildings the following primary energy factors were applied:

- 0.7 for heating (district heat or biomass);
  - 2.0 for electricity.

## RES in energy frames and nZEB applications (2015 data)

- In 2013 RES was not yet implemented in present calculation frames in 5 out of 10 countries with nZEB application
- Most of energy frames were not yet ready to support exported energy:
  - Full utilization on annual bases: Denmark, Estonia, net plus energy program in Germany
  - Monthly bases (limited to the amount of the delivered electricity each month and the rest of exported is not accounted): Germany
  - Not accounted: Finland, Norway, Italy, ...
- 8 out of 13 countries have set specific indicator for RES in nZEB application (2015 data)
- There is no information that nearby RES has implemented in any country, however ongoing in DK, FI ... – but mostly a future issue to be solved with RES inclusion and exported energy

## nZEB requirements 4/2015

- Primary energy and % of minimum EP requirements are used as nZEB EP indicator in most of countries
- The range of values varies remarkably from positive energy buildings up to 270 kWh/m<sup>2</sup>/y primary energy:
  - from to 20 kWh/m²/y to160 kWh/m²/y in residential buildings, but usually targets aim at 45 kWh/m²/y or 50 kWh/m²/y
  - Values from 25 kWh/m<sup>2</sup>/y to 270 kWh/m<sup>2</sup>/y are reported for nonresidential buildings with higher values given for hospitals.
  - Remarkable differences caused mostly due to different energy uses included, but the methodologies/input data have an effect and evidently there are differences in the ambition level
- nZEB primary energy values show a reduction by factor of 1.6 in Estonia and by 2 in Denmark compared to current EP minimum requirements of office buildings (reduction of 40-50%)

## **Open nZEB issues**

- 1. Energy uses accounted:
  - major difference if accounting or not appliances & lighting
- 2. System boundary
  - onsite and nearby RES accounting (follows or not energy meters)
- 3. Time step: hourly vs. monthly calculation
- 4. Period and type of balance when accounting RES export
  - Annual or limitations for instance on monthly level
- 5. Numerical indicators of energy performance
  - Primary energy not yet fully established
  - Qualitative/quantitative RES accounting
- 6. Building categories
  - Standard uses and requirements for non-residential buildings

## **Energy uses accounted**

- 7 countries out of 13 account appliances (AT, BG, EE, FI, LV, LT, NL), the rest do not
- 6 countries account lighting in residential buildings (EE, FI, FR, LT, SE, UK)
- Appliances and lighting correspond to 50-60 kWh/m<sup>2</sup>y primary energy in residential buildings

#### Inclusion of appliances and lighting – EE

- VV No 68: 2012 Minimum requirements for energy performance
- Minimum requirements are given for 9 building types, for new buildings and for major renovation
- nZEB and low energy building requirements officially given together with cost optimal minimum requirements

Primary energy factors:

Electricity 2.0, Fossil fuels 1.0, District heat 0.9 and Renewable fuels 0.75

	nZEB [kWh/m²y]	Low energy [kWh/m²y]	Min. req. NEW [kWh/m²y]	Min. req. Major REN [kWh/m²y]
EPC class	Α	В	С	D
Detached houses	50 <b>(0</b> ª)	120	160 <b>(110ª)</b>	210
Apartment buildings	100 <b>(41ª)</b>	120	150 <b>(101ª)</b>	180
Office buildings	100 <b>(62<sup>b</sup>)</b>	130	160 <b>(128<sup>b</sup>)</b>	210

<sup>a</sup> without lighting and appliances, <sup>b</sup> without appliances

## **Building categories**

- Steering to optimal design solutions: define standard use/ nZEB requirement for each building category
- Usages, intensities and operation times vary a lot between different building categories – optimal EE and RES measures differ accordingly
- EPBD Annex I building categories are relevant except hospitals
- Hospitals (EE nZEB=270) could be replaced with clinics/healthcare centers (12/24 and 5/7 operation instead of 24/24 and 7/7 operation with high loads from hospital equipment)
- Industrial buildings (very often without significant heat gains from the process) will deserve a separate category
- Grocery stores another specific category because EP depends mostly on the refrigeration condensation heat utilization

## **The effect of building categories – EE**

#### VV No 68: 2012 – Full set of EP requirements/standard use input data

	nZEB	Low energy	Minimum req. NEW (cost opt.)	Minimum req. Major REN
EPC class	А	В	С	D
Building category	kWh/(m² y)	kWh/(m² y)	kWh/(m² y)	kWh/(m² y)
Detached houses	50	120	160	210
Apartment buildings	100	120	150	180
Office buildings	100	130	160	210
Hotels and restaurants	130	160	210	270
Public buildings (theatres, sport halls, museums etc.)	120	150	200	250
Shopping malls	130	160	230	280
Schools	90	120	160	200
Day care centres	100	140	190	240
Hospitals	270	300	380	460

## **nZEB system boundaries**

4-level system boundary needed to enable transparent calculation:

- 1. Energy need
- 2. Energy use
- 3. Delivered and exported on-site
- 4. Nearby RE

REHVA

D. D'Agostino / Journal of Building Engineering 1 (2015) 20-32

## Conclusions

- To date, an official definition with numeric indicators is available in 15 MS (+ Brussels Capital Region and Flanders)
  - In 3 countries implementation in the legislation is in progress
  - In the remaining 9 MS (plus Norway and the Belgian Region of Wallonia), the definition is still under discussion
- The most urgent open nZEB issues to be harmonized are energy uses included (to be comparable), system boundaries and RES inclusion (to be transparent) and building categories (to be meaningful for design choices):
  - Exclusion of the energy uses may led to situation where calculated energy use represents only a small fraction of measured energy use in real buildings
  - Requirements set only for residential and non-residential show that majority of countries cannot tackle the eight building categories specified in EPBD recast Annex I
- REHVA nZEB extra cost of about +200 €/m<sup>2</sup> remains a challenge, however some examples of 55-100 €/m<sup>2</sup> do exist
