

## PRESS RELEASE

### EU project "QUEST" pushes financial Investments for quality management in buildings

The recently launched EU project "QUEST" is intended to **significantly improve energy savings in buildings**. 30 to 40 percent of the CO2 Emissions are caused today by real estate. That is why the energetic improvement of the building stock is a key asset for Europe for the achievement of climate targets. With QUEST, a strong lever is now set up here: In an international consortium, the economic impact of

operational risks of modern buildings and mitigation by quality management is scientifically examined and made measurable. The goal is to show how the risks can be minimized so that developers, banks and insurance companies can reliably invest in quality management.

*"We literally waste resources and money in the construction poor quality buildings",* explains Dr. Stefan Plesser, synavision GmbH Managing Director and QUEST consortium Coordinator. Comprehensive research has shown that inadequately commissioned and badly operated buildings are a key cause of high CO2 emissions from buildings. Only in 2009 in Europe, more than eleven billion euros have been spent to eliminate deficiencies. Plesser continues: *"Thanks to software and digitalization, we have the technical tools to reduce those risks. With the QUEST project we now have the option of linking attractive financial products investments with the necessary quality management"*.

...

In the context of QUEST, **expert workshops** will be held on building quality and financial products. If you are interested in participating, you can now request information without obligation under [info@synavision.de](mailto:info@synavision.de) or at <https://www.synavision.de/de/contact/>.

QUEST is funded under the HORIZON 2020 program by the European Union (Grant Agreement 846739).
